U1-E-C11 is a normalized cDNA library containing the following tissue(s): RPE and Choroid. The library was constructed according to Bonaldo, Lennon and Soares,
Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dr primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I; and cloned directionally into pT7T3-Pac vector. The oligonuclecide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT) B tail. The sequence tag for this library is ACCTA.
This library was created for the program, Gene Discovery in the Visual System, supported by National Bye Institute (NBI)."

eye disease. 100ug of total RNA was used for library construction. A directionally cloned CDNA library in the pSPORTI vector (Life Technologies) was constructed at Bioserve Biotechnology (Laurel MD) essentially following the protocols of the SuperScript Plasmid System full details of which are contenied in the manufacturer's Instruction manual (http://www.lifetech.com/). First strand synthesis was carried out using a Not I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  20

/notes="Organ: Eye; Vector: Eye; Vector: Invitrogen) was constructed at Bioserve Biotechnology
(Laurel MD) essentially following the protocols of the
SuperScript Plaamid System full details of which are
contained in the manufacturer's Instruction manual
(http://www.lifetech.com/). First strand synthesis was
carried out using a Not I primer-adapter
[5.-pGACTAGTTCTAGATCGCGAGCGCCC(T)15-3']. cDNA was
cloned in Not I/Sal I sites. EST analysis was performed on
the unamplified library at the NIH Intramural Sequencing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SerProGluAspLeuThrValLysValGlnAspAspPheValGluIleHisGlyLysHis 100

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      셤
           Cotal RNA was extracted from 200 adult mouse whole eyes. A directionally cloned CDNA library in the pSPORT1 vector (Invitrogen) was constructed at Bioserve Biotechnology (Laurel MD) essentially following the protocols of the SuperScript Plasmid System full details of which are contained in the manufacturer's Instruction manual (http://www.lifetech.com/). First strand synthesis was carried out using a Not I primer-adapter [5'-pGACTAGTTCTAGATCGCGAGCGGCCC(7)15-3']. CDNA was cloned in Not I/Sal I sites. EST analysis was performed on the unamplified library at the NIH Intramural Sequencing Center (NISC)."

/ note="Organ: Eye; Vector: pSport1; Approximately Img
total RNA was extracted from 200 adult mouse whole eyes. A
directionally cloned cDNA library in the pSPORT1 vector
(Invitrogen) was constructed at Bioserve Biotechnology
(Laurel MD) essentially following the protocols of the
SuperScript Plasmid System full details of which are
contained in the manufacturer's Instruction manual
(http://www.lifetech.com/. First strand synthesis was
carried out using a Not I primer-adapter
[5'-pGACTAGTTCTAGATCGCGACGCCCCC(CT)15-31]. CDNA was
cloned in Not I/Sal I sites. EST analysis was performed on
the unamplified library at the NIH Intramural Sequencing
Center (NISC)."

directionally cloned cDNA library in the pSPORTI vector (Invitrogen) was constructed at Bloserve Blotechnology (Laurel MD) essentially following the protocols of the SuperScript Plasmid System full details of which are contained in the manufacturer's Instruction manual (http://www.lifetech.com/). First strand synthesis was carried out using a Not I primer-adapter [5·pGACTAGTTCTAGATCGCAGCGGCCC(T)15-3']. cDNA was cloned in Not I/Sal I sites. BST analysis was performed on the unamplified library at the NIH Intramural Sequencing Center (NISC)."

This CDS clone is a part of a collection of human full length expression clones generated by RZPD.	This CDS has been cloned without stopcodon. The CDS has been inserted into pDONR201 via a BP Clonase (TM)	reaction. Additional sequence has been added in front of the start codon (ATG): att AAAAA GCT GGC ACC CCT GGT CCA GCT (ATG)	After the last codon additional sequence has been added: CCA GGC CCA GGC GGC in front of the 3' att site (AC CCA GCT TTC TT).	Compared to the reference sequence occaso, we are not thin any among acid exchanges.			/ db	RF Clones Gateway (TM) -	: puonkzui, site_i: attri; site_z: attrz	1, -yeure - curral 1, -yeure - curral /creme - TRYAA"	/codon start=1 /profeIn id="CAG28619.1"	/db_xref="G1:47115319"  /translation="MDVTHQHWFKRTLGPFYPSRLFDQFFGEGLFEYDLLPFLSSTI  cpayedog.remun.neg1servennesv1FingkHRSPRFIGHR	RODDHGYISREFHRRYRLPSNVDQSALSCSLSADGMLTFCGFKIQTGLDATHABRAIP VSREEKPTSAPSS"

alpha A-crystallin messenger RNA of the mouse lens: more noncoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Original gource text: Mouse lens, cDNA to mRNA.

The crystallins contribute 90% of the soluble lens protein and are highly connerved during evolution. There are four immunologically. separate classes of crystallins called alpha-beta-, gamma-, and delta-crystallin. The mRNA of the alpha-A-crystallin from mouse, like that from cows and rats, is nearly three times the size required to code for the polypeptide. Nucleotides 1-490 of the mouse alpha-A-crystallin mRNA predict a protein sequence identical to amino acids 10-173 of rat alpha-A-crystallin.
                                                                                                458

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   in
                                                                                                                                                                                                                                                                                          Primary structure of cloned cDNA coding alpha-A2 crystallin of eye lens of the frog Rana temporaria
Dokl. Biochem. 271, 277-280 (1984)
Data Kindly reviewed (05-11-1985) by S.I. Tomarev
Sequence 1 to 185 is complementary to sequence 553 to 369 and probably a cloning artefact; amino terminal amino acids are missing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SerGluValArgSerAspArgAspLysPheValIlePheLeuAspValLysHisPheSer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               LeuPheAspGlnPhePheGlyGluGlyLeuPheGluTyrAspLeuLeuProPheLeuSer
